

MORE ENERGY, LESS CO₂!

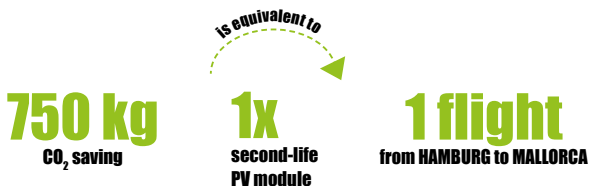

Do your part to protect the climate
with recycled photovoltaic modules

SECOND-LIFE PV MODULES CUT COSTS AND CO₂!

Many photovoltaic modules sent for disposal in Germany are still functional and fit for use! HME Hamburger Müllentsorgung Rohstoffverwertungsgesellschaft mbH set up 2ndlifesolar with this in mind. HME is a certified processing firm for used modules and examines them with a view to reusing them in future. Choosing second-life PV modules has enormous advantages: they come at a reduced price, still deliver excellent performance and conserve resources. They offer significant price savings compared to purchasing new modules. In addition, by using second-life products, PV operators make an active contribution to climate protection by minimising their carbon footprint.

Peace of mind for system operators

We examine each PV module in detail to analyse its suitability for use. In addition to visual checks, the modules undergo extensive technical inspections that include checking whether the module functions and examining its electrical safety. We then compile the results in a test report.

Benefits for the climate and your budget

Cost-effective and
fully functional modules

Test record certifies
functionality

Climate protection (CO₂ savings,
resource conservation)
